# 1 About This Guide

## 1.1 Purpose

This manual mainly describes the I/O standards, the I/O banking scheme, and the functions of the I/O logic. It also explains the GPIO architecture and the usage of the Gowin EDA software, enabling users to gain a deeper understanding of the GPIO features and design rules.

# 2 GPIO Overview

The GPIOs of the Gowin FPGAs support a wide range of I/O standards, from single-ended I/O standards to differential I/O standards, enabling easy interfacing with various external buses, memory devices, video applications, and other standard protocols.

The basic blocks of the GPIO in the GOWINSEMI FPGA products are IOB, including I/O buffer, I/O logic, and the relevant programmable routing unit. The programmable routing unit is similar to the CRU in CFU.

As shown in Figure 2-1, each IOB contains two pins (A and B). They can be used as a differential pair or as a single-end input/output. The I/O buffer supports both single-ended and differential standards. The I/O logic supports deserializer, serializer, delay control, and byte alignment, and is suitable for high-speed data transmission. The programmable routing unit is used to inter-connect I/O blocks with other on-chip resources.

Figure 2-1 IOB Structure View

The features of the input/output blocks in Gowin FPGA series are:

- Vccio is supplied based on bank.
- Supports LVCMOS, PCI, LVTTTL, LVDS, SSTL, and HSTL.
- Some devices <sup>[1]</sup> support the MIPI standard and MIPI I3C OpenDrain/PushPull conversion.
- Supports input hysteresis option
- Supports output drive strength option
- Supports individual bus keeper, pull-up/down resistor, and open drain output options
- Supports hot socket
- I/O logic supports SDR mode and DDR mode, etc.

**Note!**

[1]: For devices that support MIPI and I3C, please refer to the devices supported in [3.6.9 MIPI\\_IBUF](#), [3.6.10 MIPI\\_OBUF](#) and [3.6.12 I3C\\_IOBUF](#).

# 3 Input/Output Buffer

## 3.1 GPIO Standards

GOWINSEMI FPGA products support both single-ended and differential standards<sup>[1]</sup>. The single-ended standard can use built-in IO voltage as a reference voltage or any I/O voltage as an external reference voltage input. All banks in GOWINSEMI FPGA products support differential input. Emulated LVDS differential output is implemented by using external resistors and differential LVCMOS buffer output. For banks supporting true LVDS differential output and differential input matching, please refer to [3.2 GPIO Banking Scheme](#) for more details.

### Note!

<sup>[1]</sup>When using differential IO standards other than the TLVDS standards (MIPI, LVDS25, RSDS, MINILVDS, PPLVDS), instantiate the ELVDS primitives and select the corresponding IO Type in FloorPlanner. For example, to use the BLVDS standard, instantiate ELVDS\_IOBUF and set the IO Type to BLVDS25E in FloorPlanner. For detailed information on the ELVDS primitives, refer to [3.6 GPIO Primitive](#).

For the pin voltage requirements for different I/O standards supported by GOWINSEMI FPGA products, please refer to the "I/O Standards" section in the corresponding data sheets:

## 3.2 GPIO Banking Scheme

The general attributes of the GPIO include:

- All banks support emulated LVDS differential output using external resistor network.
- All banks support pull up, pull down, and bus-keeper settings.
- Each bank supports one kind of pin voltage.
- Each bank supports one reference voltage signal, whether it is from an external pin or from the internal reference voltage generator.

## 3.3 Power Supply Requirements

GOWINSEMI FPGA products can be powered and operated when  $V_{CC}$  and  $V_{CCIO}$  reach a certain threshold and POR is set. During configuration, all GPIOs of the device are high-impedance with internal weak pull-ups<sup>[1]</sup>. After the configuration is complete, the I/O state is controlled by user programs and constraints. The state of CONFIG-related I/Os varies depending on the configuration mode. There are no power-on and power-off sequence requirements for core voltage and pin voltage for GOWINSEMI FPGA products.

**Note!**

[1] GW2AN-18X/9X GPIOs are internally weak pull-down.

Each bank supports one reference voltage input ( $V_{REF}$ ). Any I/O in one Bank can be configured as an input reference voltage. To support SSTL and HSTL, the reference voltage can be set as half of the I/O voltage. The input reference voltage can also be generated by the internal reference voltage generator. The internal reference voltage generator and the external reference voltage cannot be effective at the same time because each bank has only one reference voltage.

The GOWINSEMI FPGA GPIO includes two input/output pins, marked as A and B respectively. Pin A corresponds to the T (True) of the differential pair, and Pin B corresponds to the C (Comp) of the differential pair.

### 3.3.1 LVCMOS Buffer Configuration

All GPIOs contain LVCMOS buffers. These LVCMOS buffers can be configured in a variety of modes to support different applications. Each LVCMOS buffer can be configured as weak pull-up, weak pull-down, and bus-keeper. The pull-up and pull-down offer a fixed characteristic, which is useful when creating wired logic such as wired ORs. The bus-keeper latches the signal in the last driven state, holding it at a valid level with minimal power consumption. Input leakage can be reduced by turning off the bus-keeper circuit.

All LVCMOS buffers have programmable drive strength. Please refer to the corresponding data sheets for the detailed drive strength of different IO standards. The drive strength of GOWINSEMI FPGA products is

guaranteed with minimum drive strength for each drive setting.

The hysteresis setting is used to prevent quick successive changes of levels in a noisy environment. All LVCMOS buffers support the hysteresis setting.

When a differential pair is configured as two single-ended pins, the relative delay between the two pins is maintained at a minimum, and the signal consistency is the best.

### 3.3.2 Differential Buffer Configuration

When a GPIO buffer is configured as a differential receiver, the input hysteresis and bus-keeper will be disabled for the buffer.

GW1N and GW2A devices which support on-chip programmable 100 Ohm input differential matching resistor are listed as below:

- Bank 0 of GW1N-4, GW1NR-4, GW1NRF-4B, GW1N-9, GW1NR-9, GW1N-1, GW1NR-1.
- Bank 0 and bank 1 of GW1N-1S, GW1NS-4, GW1NS-4C, GW1NSR-4, GW1NSR-4C, GW1NSER-4C, GW2A-18, GW2A-55, GW2AN-55, GW2ANR-18, GW2AR-18.
- Bank 2 of GW1N-2, GW1NR-2, GW1N-1P5.
- Bank 4 and bank 5 of GW2AN-18X, GW2AN-9X.

All the single-ended GPIO buffer pairs can be configured to support emulated LVDS differential output standards, such as LVPECL33E, MLVDS25E, BLVDS25E, etc. An off-chip impedance matching network is also required.

## 3.4 Emulated Differential Circuit Matching Network

### 3.4.1 Emulated LVDS

GOWINSEMI FPGA products can build compatible LVDS output standards via the complementary LVCMOS output and external matching network. Figure 3-1 shows the external matching network.

## 3.5 GPIO Software Configuration

You can set GPIO location, attributes, etc. through Floorplanner in Gowin Software, or you can customize the CST file to achieve this. The following is a detailed description of the physical constraints supported by CST files.

### 3.5.1 Location

Lock the physical location of GPIO:

```
IO_LOC "xxx" H4 exclusive;
```

### 3.5.2 I/O Standard

Set the I/O standard for the GPIO:

```
IO_PORT "xxx" IO_TYPE=LVCNOS18D;
```

### 3.5.3 Drive Strength

Set the drive strength of output pins or IO pins:

```
IO_PORT "xxx" DRIVE=12;
```

### 3.5.4 Pull Up/Pull Down

Set pull up/down modes, such as UP (pull-up), DOWN (pull down), KEEPER (bus-keeper), and NONE (high impedance).

```
IO_PORT "xxx" PULL_MODE=DOWN;
```

### 3.5.5 Voltage Reference

Set reference voltage for GPIO. The reference voltage can be from external pins or internal reference voltage generator.

```
IO_PORT "xxx" VREF=VREF1_LOAD;
```

### 3.5.6 Hysteresis

Set the hysteresis value for input pins or bidirectional IO pins. The value is NONE, H2L, L2H, HIGH from small to large in sequence.

```
IO_PORT "xxx" HYSTERESIS=L2H;
```

### 3.5.7 Open Drain

Open Drain is available for both output and bidirectional IO pins. The values are ON and OFF.

```
IO_PORT "xxx" OPEN_DRAIN=ON;
```

### 3.5.8 Termination Resistors for Single-ended Signal

Set termination matching resistors for single-ended signals. The values are OFF and ON.

```
IO_PORT "xxx" SINGLE_RESISTOR=ON;
```

### 3.5.9 Termination Resistor for Differential Signal

Set termination matching resistors for differential signals. The values are OFF and ON.

```
IO_PORT "xxx" Diff_RESISTOR=ON;
```

## 3.6 GPIO Primitive

IO Buffer with buffer function includes normal buffer, emulated LVDS, and true LVDS.

### 3.6.8 LVDS Inout Buffer

#### Primitive Introduction

The LVDS inout buffer includes TLVDS\_IOBUF and ELVDS\_IOBUF.

True LVDS Bi-Directional Buffer (TLVDS\_IOBUF) is used as true differential input buffer when OEN is high and used as true differential output buffer when OEN is low.

#### Devices Supported

### 3.6.9 MIPI\_IBUF

#### Primitive Introduction

MIPI Input Buffer (MIPI\_IBUF) includes HS input mode and LP bi-direction mode, and HS mode supports dynamic resistor configuration.

#### Devices Supported

Table 3-10 Devices Supporting MIPI\_IBUF

Product Family	Series	Device
LittleBee	GW1N	GW1N-9, GW1N-9C, GW1N-2, GW1N-2B, GW1N-2C, GW1N-1P5, GW1N-1P5B, GW1N-1P5C

	GW1NSER	GW1NSER-4C
	GW1NSR	GW1NSR-4, GW1NSR-4C
Arora	GW2AN	GW2AN-18X, GW2AN-9X

#### Functional Description

MIPI\_IBUF supports LP and HS mode. IO and IOB are connected to pad.

LP mode: Supports bi-directional. When OEN is low, I is input and IO is output; when OEN is high, IO is input and OL is output; when OENB is low, IB is input and IOB is output; when OENB is high, IOB is input and OB is output.

HS mode: IO and IOB are the differential inputs. OH is the output, then HSREN controls the termination resistor.

### 3.6.11 MIPI\_OBUF\_A

#### Primitive Introduction

MIPI\_OBUF\_A includes HS mode and LP mode.

MIPI Output Buffer with IL Signal (MIPI\_OBUF\_A) is used as (HS) MIPI output buffer when MODESEL is high and used as (LP) MIPI output buffer when MODESEL is low. The difference with MIPI\_OBUF is the addition of the IL port as an A input in LP mode.

#### Devices Supported

For the devices supported by MIPI\_OBUF\_A, apart from the devices listed in Table 3-12, you can also see the table below.

## 3.6.13 MIPI\_IBUF\_HS/MIPI\_IBUF\_LP

### Primitive Introduction

MIPI\_IBUF\_HS implements HS mode for differential input and MIPI\_IBUF\_LP implements LP mode via single-ended input.

## Devices Supported

Table 3-18 Devices Supporting MIPI\_IBUF\_HS/MIPI\_IBUF\_LP

Family	Series	Device
LittleBee	GW1N	GW1N-1S
	GW1NR	GW1NR-2

## Functional Description

You can use the combination of MIPI\_IBUF\_HS and MIPI\_IBUF\_LP to support HS and LP modes via Floorplanner. Input I of MIPI\_IBUF\_HS and I of MIPI\_IBUF\_LP should be connected to the same signal, and input IB of MIPI\_IBUF\_HS and IB of MIPI\_IBUF\_LP should be connected to the same signal.

IB	Input	In LP mode, B single-ended input signal.
OL	Output	In LP mode, A-ended output signal.
OB	Output	In LP mode, B-ended output signal.

## Connection Rule

- The output OH of MIPI\_IBUF\_HS can be connected to lologic.
- The output OL and OB of MIPI\_IBUF\_LP are not allowed to be connected to lologic.

### 3.6.14 ELVDS\_IBUF\_MIPI

#### Primitive Introduction

ELVDS\_IBUF\_MIPI (Emulated LVDS Input MIPI Buffer) implements HS mode and LP mode at the same time. Port A supports HS mode while port B implements LP mode only.

#### Functional Description

ELVDS\_IBUF\_MIPI supports LP and HS modes. Port I and port IB are connected to the pad.

LP mode: Port IB is input; port OL is output.

HS mode: Port I and Port IB are differential input; port OH is output.

# 4 Input/Output Logic

I/O logic in GOWINSEMI FPGA products supports SDR and DDR modes, etc. In each mode, pin control (or pin differential signal pairs) can be configured as output signal, input signal, bi-directional signal and tristate output signal (output signal with tristate control).

**Note!**

- IOL6 and IOR6 pins of devices of GW1N-1, GW1NR-1, and GW1NZ-1 do not support IO logic.
- IOT2 and IOT3A pins of GW1N-2, GW1NR-2, GW1N-1P5, GW1N-2B, GW1N-1P5B, GW1NR-2B devices do not support IO logic.
- IOL10 and IOR10 pins of the devices of GW1N-4, GW1N-4B, GW1NR-4, GW1NR-4B, GW1NRF-4B, GW1N-4D and GW1NR-4D do not support IO logic.

Figure 4-1 shows the output of the I/O logic in GOWINSEMI FPGA products.

**Figure 4-1 I/O Logic View-Output**

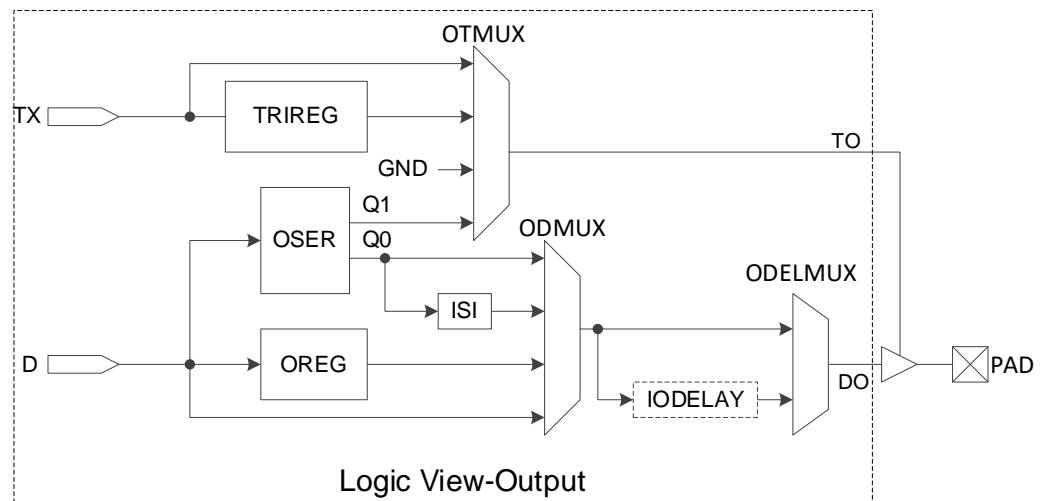

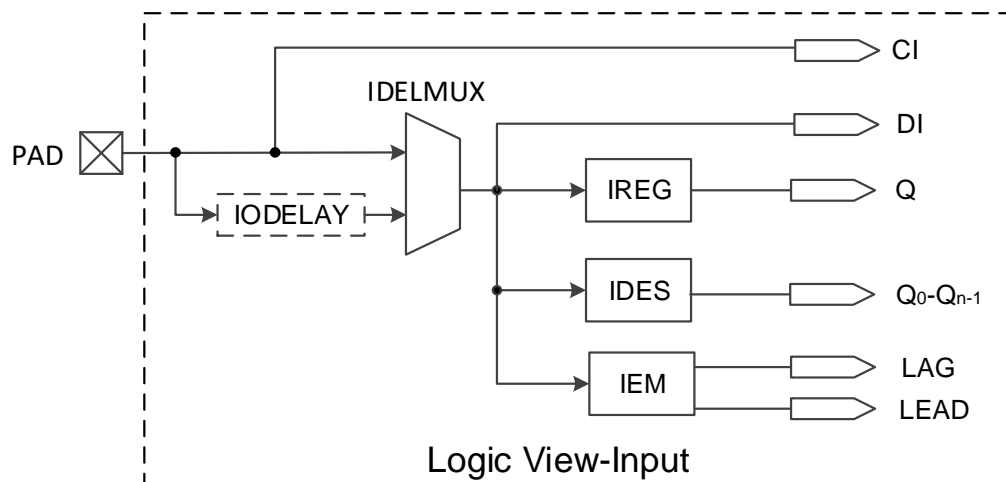

Figure 4-2 shows the input of the I/O logic in GOWINSEMI FPGA products.

Figure 4-2 I/O Logic View-Input

**Note!**

CI is the GCLK input signal and cannot connect to Fabric; DI is directly entered into Fabric.

## 4.1 SDR Mode

The input/output logic supports SDR mode and provides input register (IREG), output register (OREG) and tristate control register (TRIREG), the functions of which are the same as FF/LATCH in CFU. The FF/LATCH can be used as lologic when the input D of the FF/LATCH is driven by a Buffer/IODELAY that does not drive other lologics, or when the output Q of the FF/LATCH only drives a Buffer/IODELAY and the Buffer is not a MIPI Buffer.

## 4.2 DDR Mode Input Logic

### 4.2.1 IDDR

#### Primitive Introduction

Input Double Data Rate (IDDR)

#### Functional Description

Output data is provided to FPGA logic at the same clock edge in IDDR mode. IDDR logic diagram is as shown in Figure 4-3 and its timing diagram is as shown in Figure 4-4.

## Connection Rule

Input D of IDDR can be directly from IBUF or from the output DO of IODELAY module.

## Primitive Instantiation

The primitive can be instantiated directly, or generated by the IP Core Generator tool. For more information, you can refer to [5 IP Generation](#).

## 4.2.2 IDDRC

### Primitive Introduction

Dual Data Rate Input with Asynchronous Clear (IDDRC) is similar to IDDR to realize double data rate input and can be reset asynchronously.

### Functional Description

Output data is provided to FPGA logic at the same clock edge in IDDRC mode.

### 4.2.3 IDES4

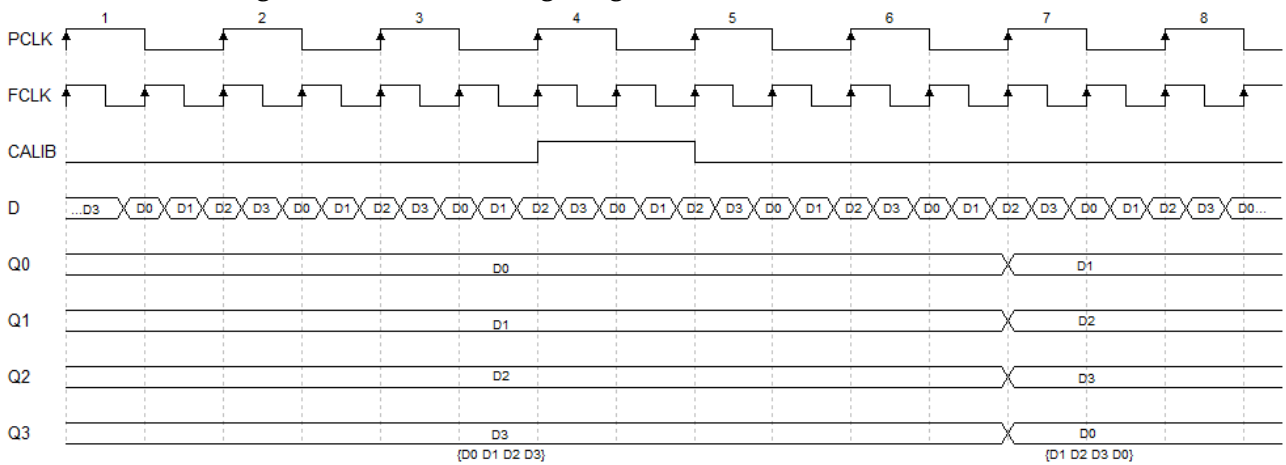

#### Primitive Introduction

The 1 to 4 Deserializer (IDES4) is a deserializer of 1 bit serial input and 4 bits parallel output.

#### Functional Description

IDES4 mode realizes 1:4 serial parallel conversion and output data is provided to FPGA logic at the same clock edge. CALIB is supported to adjust the sequence of output data. The data is shifted by one bit per pulse. After four shifts, the data output will be the same as the data before the shift. CALIB Timing diagram is as shown in Figure 4-7.

Figure 4-7 CALIB Timing Diagram

**Note!**

The pulse width and timing of the CALIB signal in the example are for reference only and can be adjusted as needed, the pulse width is equal to or greater than  $T_{PCLK}$ .

PCLK is usually obtained by FCLK frequency division:

$$f_{PCLK} = 1/2 f_{FCLK}$$

## 4.2.7 IDES16

### Primitive Introduction

The 1 to 16 Deserializer (IDES16) is a deserializer of 1 bit serial input and 16 bits parallel output.

### Devices Supported

Table 4-13 Devices Supporting IDES16

Product Family	Series	Device
LittleBee	GW1N	GW1N-1S, GW1N-9, GW1N-9C, GW1N-2, GW1N-1P5, GW1N-2B, GW1N-1P5B
	GW1NR	GW1NR-9, GW1NR-9C, GW1NR-2, GW1NR-2B
	GW1NS	GW1NS-4, GW1NS-4C
	GW1NSER	GW1NSER-4C
	GW1NSR	GW1NSR-4, GW1NSR-4C

### Functional Description

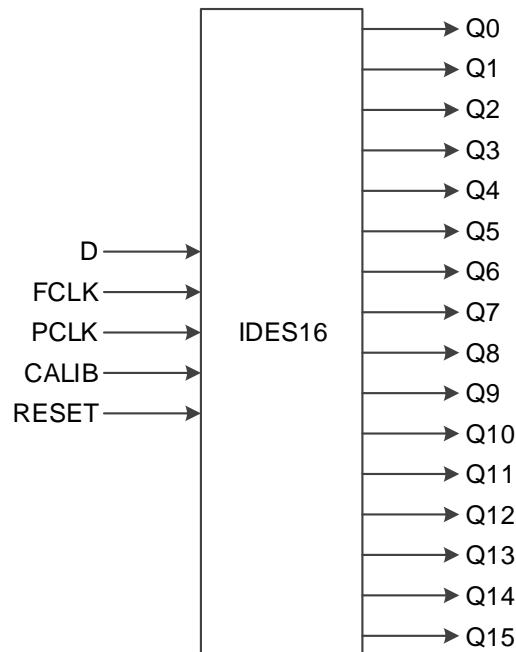

IDES16 mode realizes 1:16 serial parallel conversion and output data is provided to FPGA logic at the same clock edge. CALIB is supported to adjust the sequence of output data. Each pulse data is shifted by one bit. After sixteen shifts, the data output will be the same as the data before the shift.

PCLK is usually obtained by FCLK frequency division:

$$f_{PCLK} = 1/8 f_{FCLK}$$

## 4.2.8 IDDR\_MEM

### Primitive Introduction

The Input Double Data Rate with Memory (IDDR\_MEM) realizes double data rate input with memory.

### Devices Supported

	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

### Functional Description

IDDR\_MEM output data is provided to FPGA logic at the same clock edge. IDDR\_MEM needs to be used with DQS. ICLK connects the DQSR90 of DQS output signals and sends data to IDDR\_MEM according to the ICLK clock edge. WADDR [2: 0] connects the WPOINT output signal of DQS; RADDR [2: 0] connects the RPOINT output signal of DQS.

The frequency relation between PCLK and ICLK is  $f_{PCLK} = f_{ICLK}$ .

You can determine the phase relationship between PCLK and ICLK according to the DLLSTEP value of DQS.

### 4.3.3 OSER4

#### Primitive Introduction

The 4 to 1 Serializer (OSER4) is a serializer of 4 bits parallel input and 1 bit serial output.

#### Functional Description

OSER4 mode realizes 4:1 parallel to serial conversion, and Q0 is the serial output, Q1 is used for the OEN signal of IOBUF/TBUF connected to Q0. TX0/TX1 is the OEN input control signal of IOBUF/TBUF, and TX0/TX1 can be synchronized with the data D0~D3 through DDR. TX0/TX1 through TRI-DDRX2 is output as Q1 connected to the OEN signal of IOBUF/TBUF; D0~D3 through ODDRX2 is output as Q0 connected to the data input I of IOBUF/TBUF, and the sequence is D0, D1, D2, D3 in order. Its logic diagram is as shown in Figure 4-21.

Figure 4-21 OSER4 Logic Diagram

PCLK is usually obtained by FCLK frequency division:

$$f_{PCLK} = 1/2 f_{FCLK}$$

### 4.3.8 ODDR\_MEM

#### Primitive Introduction

Dual Data Rate Output with Memory (ODDR\_MEM) realizes double data rate output with memory.

#### Devices Supported

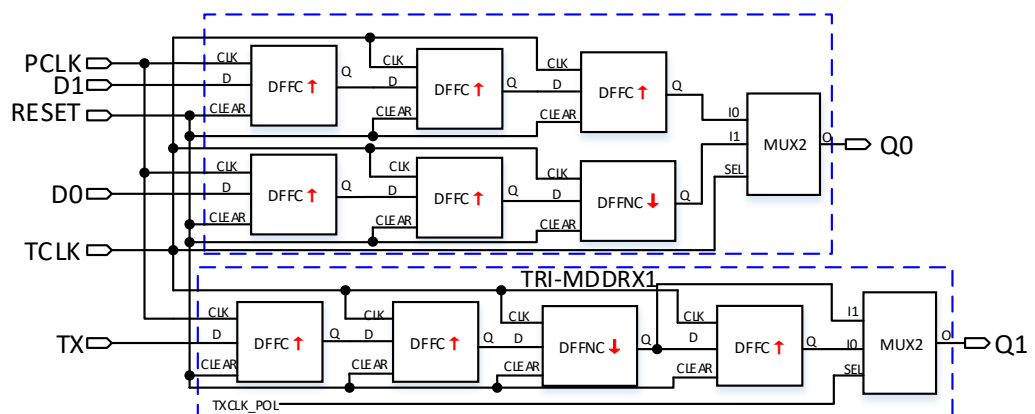

Table 4-40 Devices Supporting ODDR\_MEM

Product Family	Series	Device
Arora	GW2A	GW2A-18, GW2A-18C, GW2A-55, GW2A-55C
	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

#### Functional Description

ODDR\_MEM mode is used for transferring double data rate signals from FPGA devices. Unlike ODDR, the output double data rate with memory (ODDR\_MEM) needs to be used with DQS. TCLK connects to the DQSW0 or DQSW270 of DQS output signal, and outputs data from ODDR\_MEM according to the TCLK clock edge. Where Q0 is the double rate data output, Q1 is used for the OEN signal of IOBUF/TBUF connected to Q0. Its logic diagram is as shown in Figure 4-28.

Figure 4-28 ODDR\_MEM Logic Diagram

The frequency relation between PCLK and TCLK is  $f_{PCLK} = f_{TCLK}$ .

You can determine the phase relationship between PCLK and TCLK according to DLLSTEP and WSTEP value of DQS.

## Port Diagram

**Connection Rule**

- Q0 can directly connect to OBUF, or connect to input port DI in IODELAY module;
- Q1 shall connect to the OEN signal of IOBUF/TBUF connected to Q0, or left floating.
- TCLK needs DQSW0 or DQSW270 from DQS module and you need to configure the corresponding parameters.

### 4.3.9 OSER4\_MEM

#### Primitive Introduction

The 4 to 1 Serializer with Memory (OSER4\_MEM) realizes 4:1 parallel serial conversion with memory.

#### Devices Supported

Table 4-43 Devices Supporting OSER4\_MEM

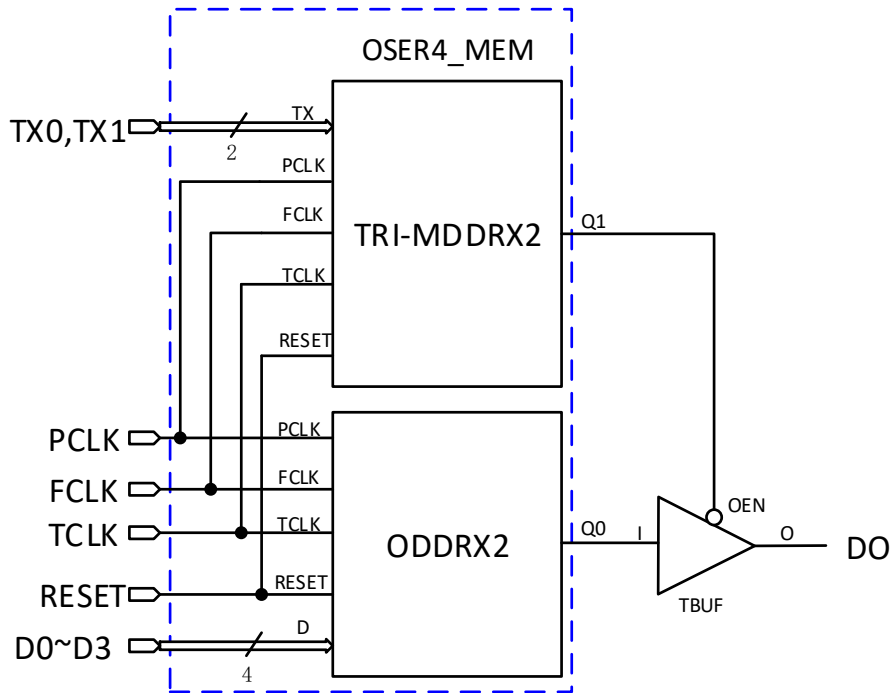

Product Family	Series	Device
Arora	GW2A	GW2A-18, GW2A-18C, GW2A-55, GW2A-55C
	GW2AN	GW2AN-55C
	GW2AR	GW2AR-18, GW2AR-18C
	GW2ANR	GW2ANR-18C

#### Functional Description

OSER4\_MEM realizes 4:1 parallel serial conversion. The TCLK connects to the output signal DQSW0 or DQSW270 of DQS, and outputs

data from the OSER4\_MEM according to the TCLK clock edge, and Q0 is the serial output, Q1 is used for the OEN signal of IOBUF/TBUF connected to Q0. Its logic diagram is as shown in Figure 4-30.

Figure 4-30 OSER4\_MEM Logic Diagram

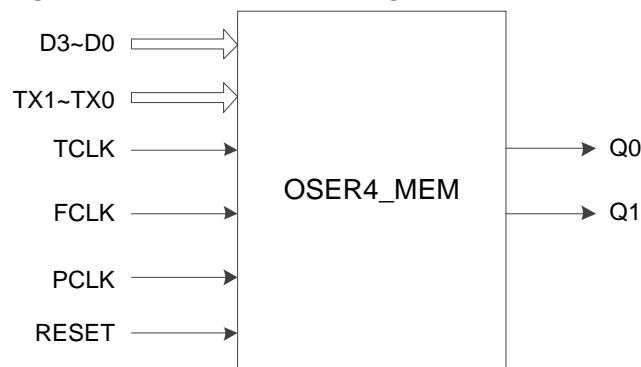

The frequency relation among PCLK, FCLK and TCLK is  $f_{PCLK} = 1/2 f_{FCLK} = 1/2 f_{TCLK}$ .

You can determine the phase relationship between FCLK and TCLK according to the DLLSTEP and WSTEP values of DQS.

## 4.4 Delay Module

### 4.4.1 IODELAY

#### Primitive Introduction

Input/Output delay (IODELAY) is a programmable delay unit in IO module.

#### Functional Description

Each IO contains an IODELAY module, providing a total of 128 (0~127) delays. The GW1N series of FPGAs have a single-step delay time of about 30ps. And the GW2A series of FPGAs have a single-step delay time of about 18ps (18K devices) or 22ps (55K devices). IODELAY can be used for input or output of I/O logic, but not for both at the same time.

## 4.5 IEM

### Primitive Introduction

Input Edge Monitor (IEM) is a sampling module in IO module.

### Functional Description

IEM is used for sampling data edge, which can be used together with delay module to adjust the dynamic sampling window for DDR mode.

### Port Diagram

Figure 4-38 IEM Port Diagram

## Port Description

Table 4-57 IEM Port Description

Port	I/O	Description
D	Input	Data input signal
CLK	Input	Clock input signal
RESET	Input	Asynchronous reset input signal, active-high.
MCLK	Input	IEM detecting clock, from user logic, acts on output flag.
LAG	Output	The lag flag after IEM edge comparison
LEAD	Output	The lead flag after IEM edge comparison

## Parameter Description

Table 4-58 IEM Parameter Description

Name	Value	Default	Description
WINSIZE	"SMALL", "MIDSMALL", "MIDLARGE", "LARGE"	"SMALL"	Window size setting
GSREN	"false", "true"	"false"	Enable global reset
LSREN	"false", "true"	"true"	Enable local reset

## Primitive Instantiation

### Verilog Instantiation:

```

IEM iem_inst(
    .LAG(lag),
    .LEAD(lead),
    .D(d),
    .CLK(clk),
    .MCLK(mclk),
    .RESET(reset)
);

defparam iem_inst.WINSIZE = "SMALL";
defparam iem_inst.GSREN = "false";
defparam iem_inst.LSREN = "true";

```

### Vhdl Instantiation:

```

COMPONENT IEM
    GENERIC (WINSIZE:string:="SMALL";
            GSREN:string:="false";
            LSREN:string:="true"

```

```
);  
  PORT(  
    LAG:OUT std_logic;  
    LEAD:OUT std_logic;  
    D:IN std_logic;  
    CLK:IN std_logic;  
    MCLK:IN std_logic;  
    RESET:IN std_logic  
  );  
END COMPONENT;

# 5 IP Generation

The software only supports DDR at present. Click DDR in the IP Core Generator interface, and a summary of DDR will be displayed on the right side of the interface.

## 5.1 IP Configuration

Double-click "DDR", and the "IP Customization" window pops up. This includes the "General", "Options", and port diagram, as shown in Figure 5-1.

Figure 5-1 DDR IP Customization

1. General: The General configuration box is used to configure the generated IP design file.

- Device: Displays the configured Device.
  - Device Version: Displays the configured device version.
  - Part Number: Displays the configured Part Number.
  - Language: Hardware description language used to generate the IP design files. Click the drop-down list to select the language, including Verilog and VHDL.
  - Module Name: The module name of the generated IP design files. Enter the module name in the text box. Module name cannot be the same as the primitive name. If it is the same, an error will be reported.
  - File Name: The name of the generated IP design files. Enter the file name in the text box.
  - Create In: The path in which the generated IP files will be stored. Enter the target path in the box or select the target path by clicking the option.
2. Options: The Options configuration box is used to customize the IP, as shown Figure 5-1.
- DDR Mode: Configures DDR mode, including input, output, tristate and bi-directional state;
  - Data Width: Configures the data width of the DDR. The range is 1~64;
  - Ratio: DDR data conversion ratio, including 2,4,7,8,10,16;
  - Reset: When Ratio is 2, this option can be enabled or disabled, and IDDR or ODDR will be instantiated when enabled;
  - IODELAY: Configures whether DDR uses a delay module;
    - "Delay Mode": Configures the delay mode. "None" means no IODELAY; "Dynamic" means using IODELAY and adjusting the delay step dynamically; "Static" means using IODELAY and adjusting the delay step statically.
    - "Delay Step": Selects the number of steps to statically adjust the delay, ranging 1 to 128.
    - "Delay Direction": In bidirectional mode, When DDR Mode is "bidirectional", if IODELAY is used, select whether IODELAY is connected to input or output.
  - Use CLKDIV: CLKDIV will be instantiated and the frequency of fclk will be divided when CLKDIV is enabled. When Ratio is 2, it cannot be checked.
3. Port Diagram: The port diagram displays a sample diagram of IP Core configuration, as shown in Figure 5-1.

## 5.2 IP Generation Files

After configuration, it will generate three files that are named after the "File Name".

- The IP design file "gowin\_dds.v" is a complete verilog module, which generates DDR modules with corresponding functions according to the configuration.
- "Gowin\_dds\_tmp.v" is the template file;
- "gowin\_padd.ipc" file is IP configuration file. You can load the file to configure the IP.

**Note!**

If VHDL is selected as the hardware description language, the first two files will be named with .vhd suffix.
